Water Box

Fitting materials

The optimal solution for connecting multiple devices to the domestic water installation.

The Naber Water Box enables the simple connection of several water consumers (faucet, dishwasher, washing machine) to a supply point. This greatly facilitates the plumbing of the water connection of various appliances in the kitchen. The boiling water fittings, drinking water filters, water dispensers, fully automated coffee machines, etc. in modern kitchens are easily connected to the domestic water installation and supplied with water via the Naber Water Box.

The Naber Water Box makes the use of various angle and bonnet valves superfluous. All consumers are connected in a space-saving way to only one connection cube and centrally supplied.

The water is supplied via a 500 mm long flexible connection hose DN 10 with a 3/8" collar nut. This connects the on-site angle valve with the Naber Water Box. The kitchen faucet, dishwasher, washing machine and other devices with a fixed water connection can simply and easily be connected to the on-site cold water angle valve via the four remaining 1/2" connections of the Naber Water Box.

When installing pressure-resistant storage water heaters, the solid brass block on the appliance safety group provides a secure hold and, thanks to the flexible installation position, ensures sufficient gradient to the drainage point of the siphon. Four mounting holes ensure good attachment to the kitchen furniture or walls.

The connection of the Water Box to an on-site angle valve may be done within the scope of the activities of the "furniture specialist for specified activities" module 2 sanitary technology (Modulreihe TÜV Rheinland Akademie www.tuv.com/moebelfachkraft) in relation to kitchen or furniture assembly.
